

Part 2: Rotated Term Listing

This rotated version of the *REHABDATA Thesaurus* is another tool for envisioning the scope and content of the REHABDATA database. Its primary purpose is to help searchers pinpoint retrieval problems that may occur when terms share a common word or phrase.

Searchers can improve their results by knowing when to use single words from multiword terms and when to spell out the entire term; this is an alphabetized listing of terms *by their component words*. For example, the rotated listing puts “supported employment” not only under “S,” where it appears in Part 1, but also under “E,” near the 20 other terms related to employment. If a person seeking information on *supported employment* uses that term rather than *employment*, the result of the search will be a set of records that is smaller and more relevant to the search need.

This listing does not demonstrate that “job,” “employment,” and “careers” are related terms, as Part 1 was designed to do.
